

Project Management:

We used Trello to manage the development of *Night Club Manager*.

Our project was organized into structured sprints to ensure steady progress and clear task tracking.

- **Before Sprint:**

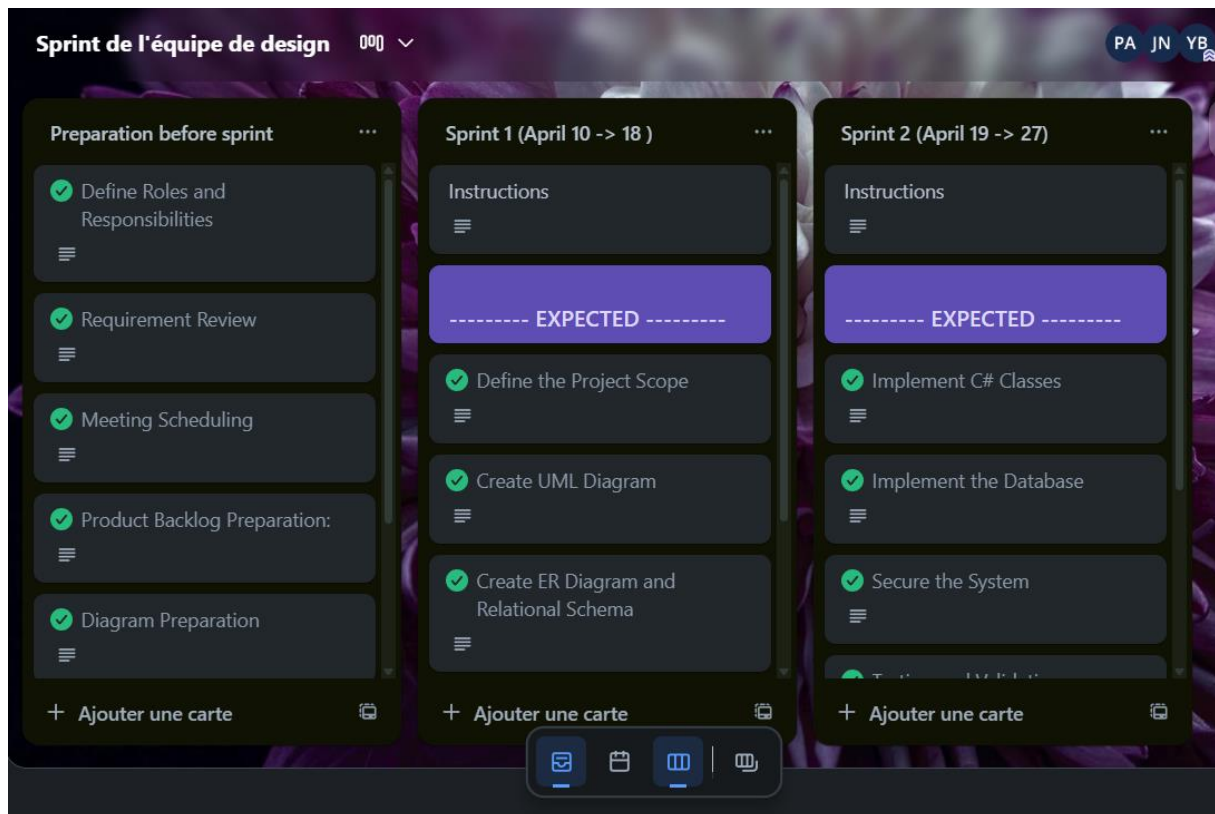

- Definition of project goals
- Drafting the database structure
- Setting up the initial Trello board

- **Sprint 1:**

- Creation of the PostgreSQL database
- Implementation of the core tables: Users, Events, Tickets, Clubs
- Establishing basic backend structure (connection, queries)
- Setting up the first version of the ticketing system

- **Sprint 2:**

- Adding advanced features (event types, statistics, etc...)
- Improving UI/UX for better navigation
- Conducting tests on database integrity and functionality
- Final debugging and optimization
- Preparing project documentation and final deliverables

Each task was assigned on Trello and followed a clear workflow: "To Do" → "In Progress" → "Done" in an other Trello board .

This method helped the team maintain good communication, focus on priorities, and deliver a stable final product.
